

Remote Access Link

Download data & check sensors remotely

Manage Surveys From the Office

The Remote Access Link attaches onto MetroCount tube classifiers and enables the transmission of sensor diagnostics and traffic data to any computer running MTE® software.

This system is used to avoid time-consuming or dangerous site visits and having to re-survey due to delays in diagnosing issues.

The Link has a modem that can be connected 24/7 to our office based control room and the data can be downloaded remotely.

This gives us the opportunity to check the sites daily without physically going to a site as well as proactively responding to issues on site. ”

Customisable Data Delivery Schedule

Choose the schedule for connecting to a classifier and sit back while the information is securely delivered to your inbox or ATLYST dashboard.

Alternatively, opt to have data validated and analysed by MetroCount experts and reports sent to you in the format of your choosing.

For Semi-Permanent or Distant Surveys

This is the right solution for managing sites that are hard to access or semi-permanent, or for saving time when surveying at multiple locations.

Durable System with 2-Year Battery Life

Protected by a water resistant, stainless steel housing, the Link has a battery life of up to 2 years.

The Remote Access Link is compatible with the RoadPod® VT, VT4, PhaseT and the RidePod® BT.
